

- Static values
 - tune once – stay forever
- Dynamic values
 - might change from pulse to pulse (ESR macro pulse every 10 s) or even within a pulse (electron separation, ejection etc.)

Note: During tuning the static values are also dynamic.

The Low Energy Beam Transfer

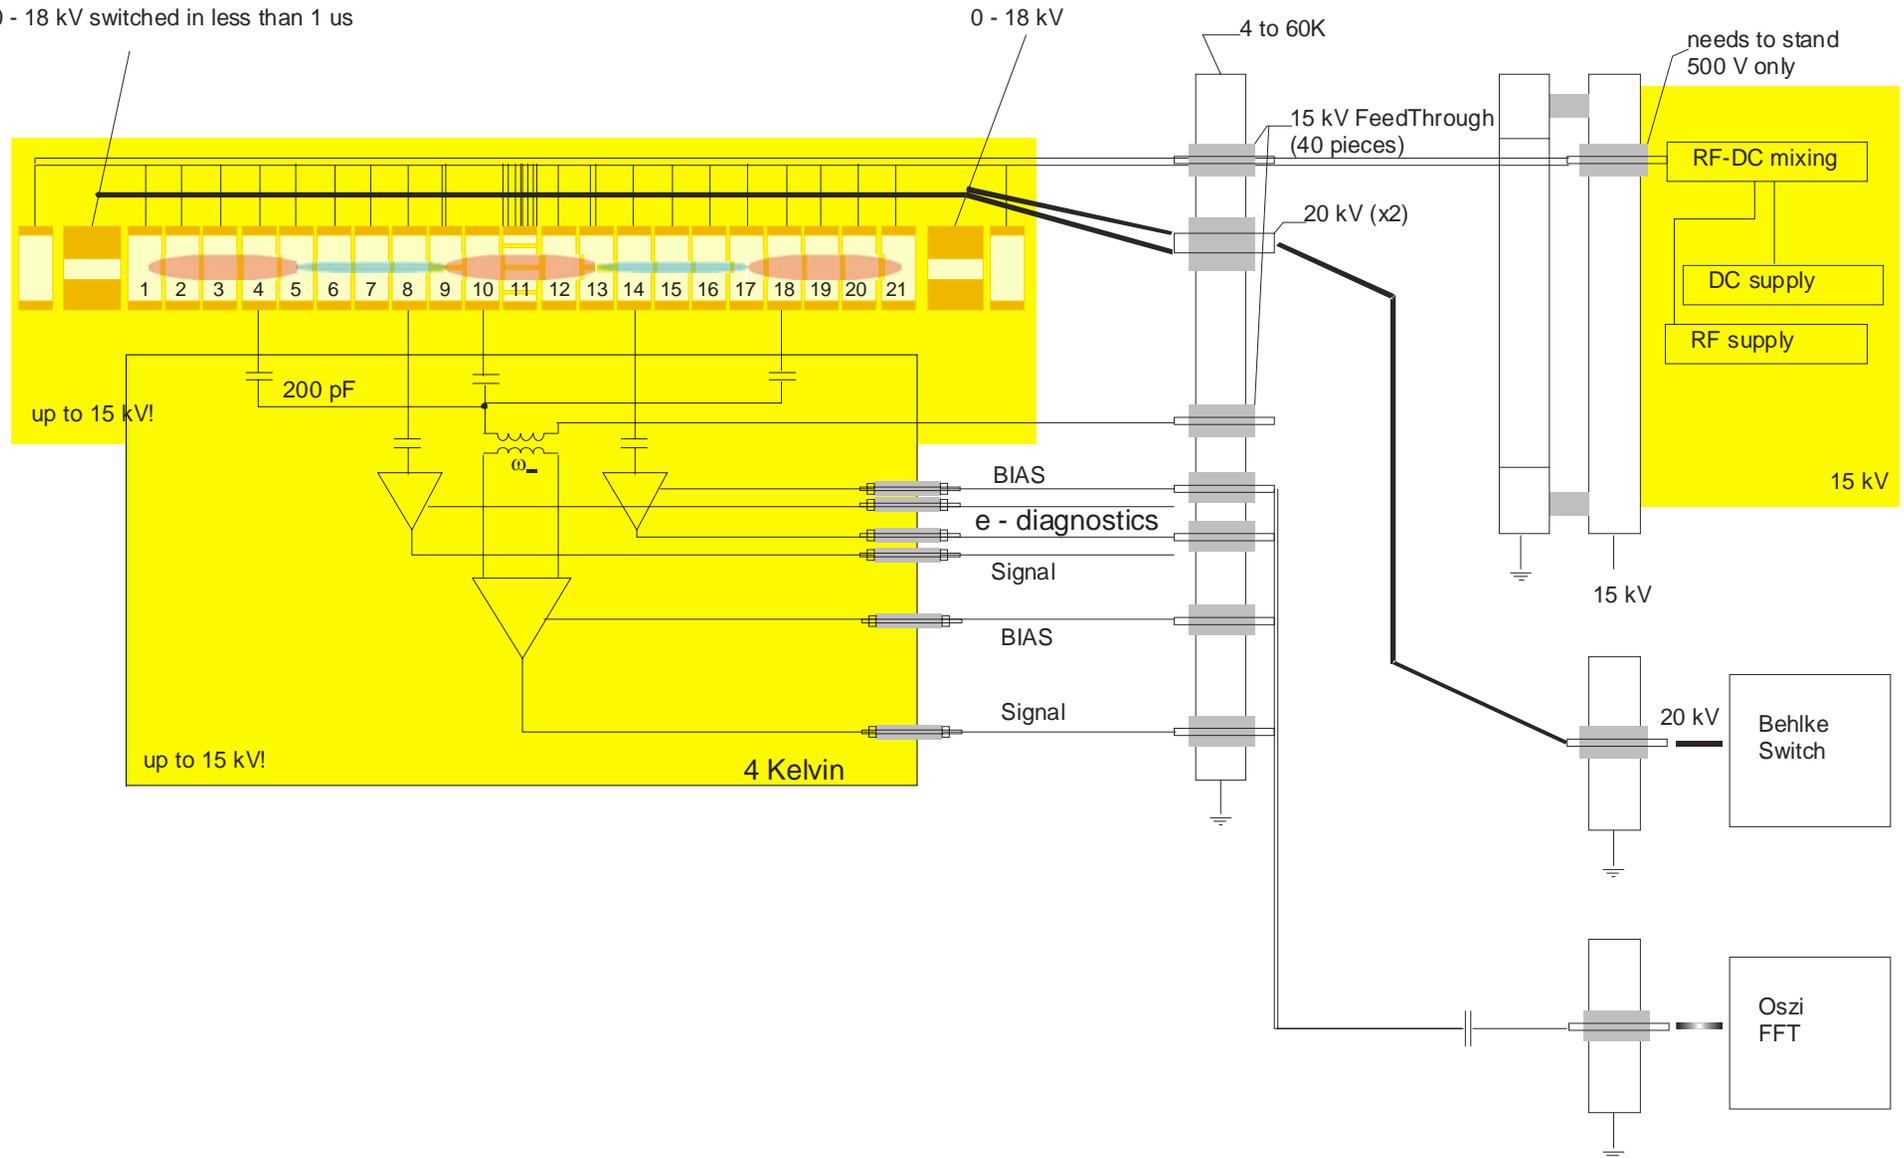

- Set, read, reset, save, load of static values
 - in groups
 - one by one
- Tuning of static values
 - change value from pulse to pulse and relate it to a given signal programmatically
- Operation of the CoolerTrap
 - static and dynamic values (voltages, frequencies, times)

Operation of the Cooler Trap

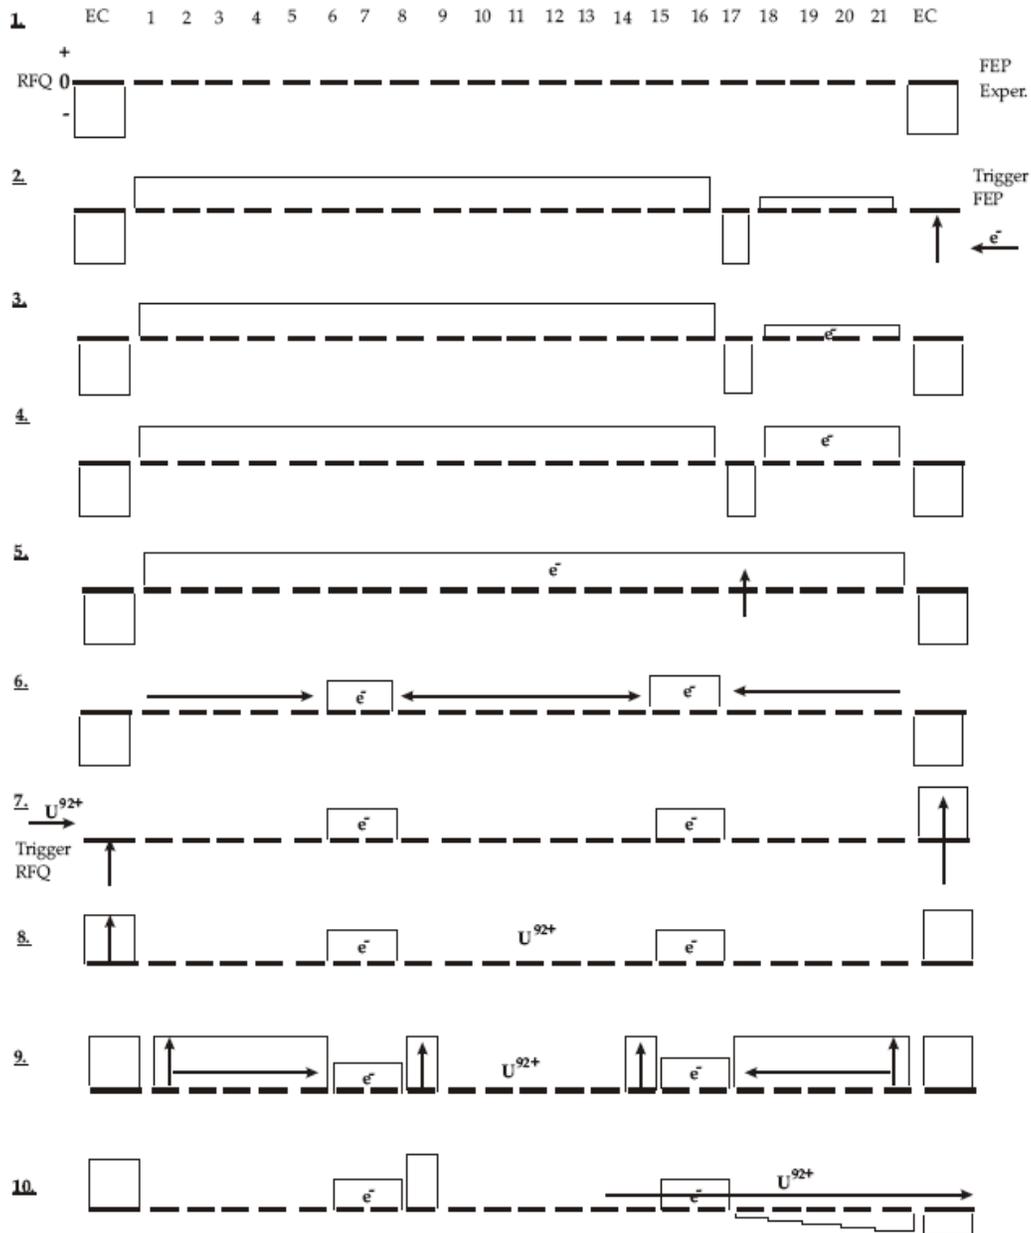

0 - 18 kV switched in less than 1 us

Sequencing

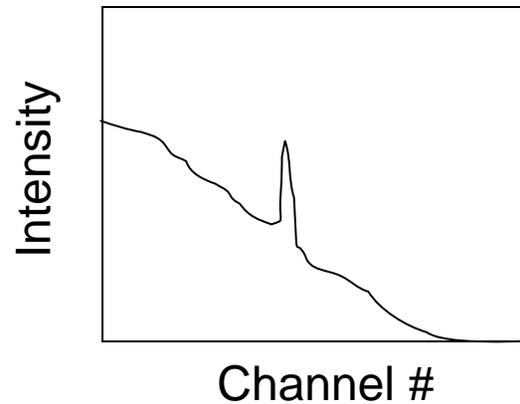

- Actual timing will be controlled by hardware (FPGA)
- Sequence and voltages might change from pulse to pulse (tuning)
- Fast voltage changes within one sequence are preprogrammed in the power supplies

Detection

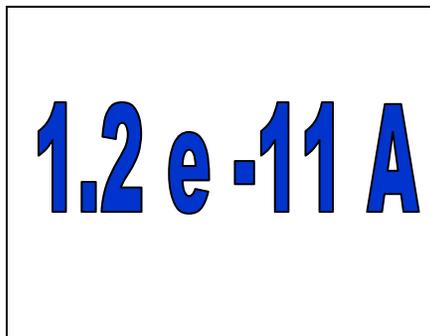

- FTICR

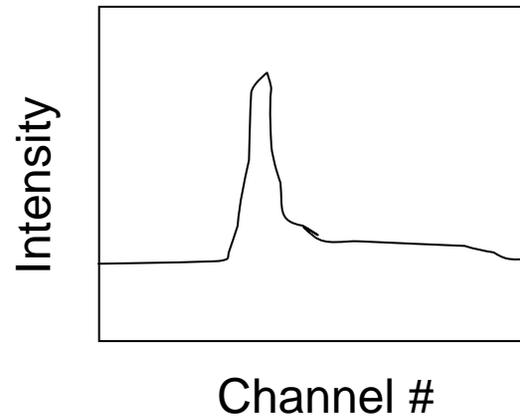

- Intensity after ejection (FC, MCP, Screen)

FC

MCP
