

TRB / HADDAQ plug-ins for DABC and Go4

Jörn Adamczewski-Musch

GSI, Experiment Electronics: Data Processing group

EE-meeting, 23.07.2012

- **Motivation**
- **Go4 trb v2/v3 unpacker and .hld user event source**
- **DABC plugin for hadaq**
- **Tests and Experience**
- **Conclusions**

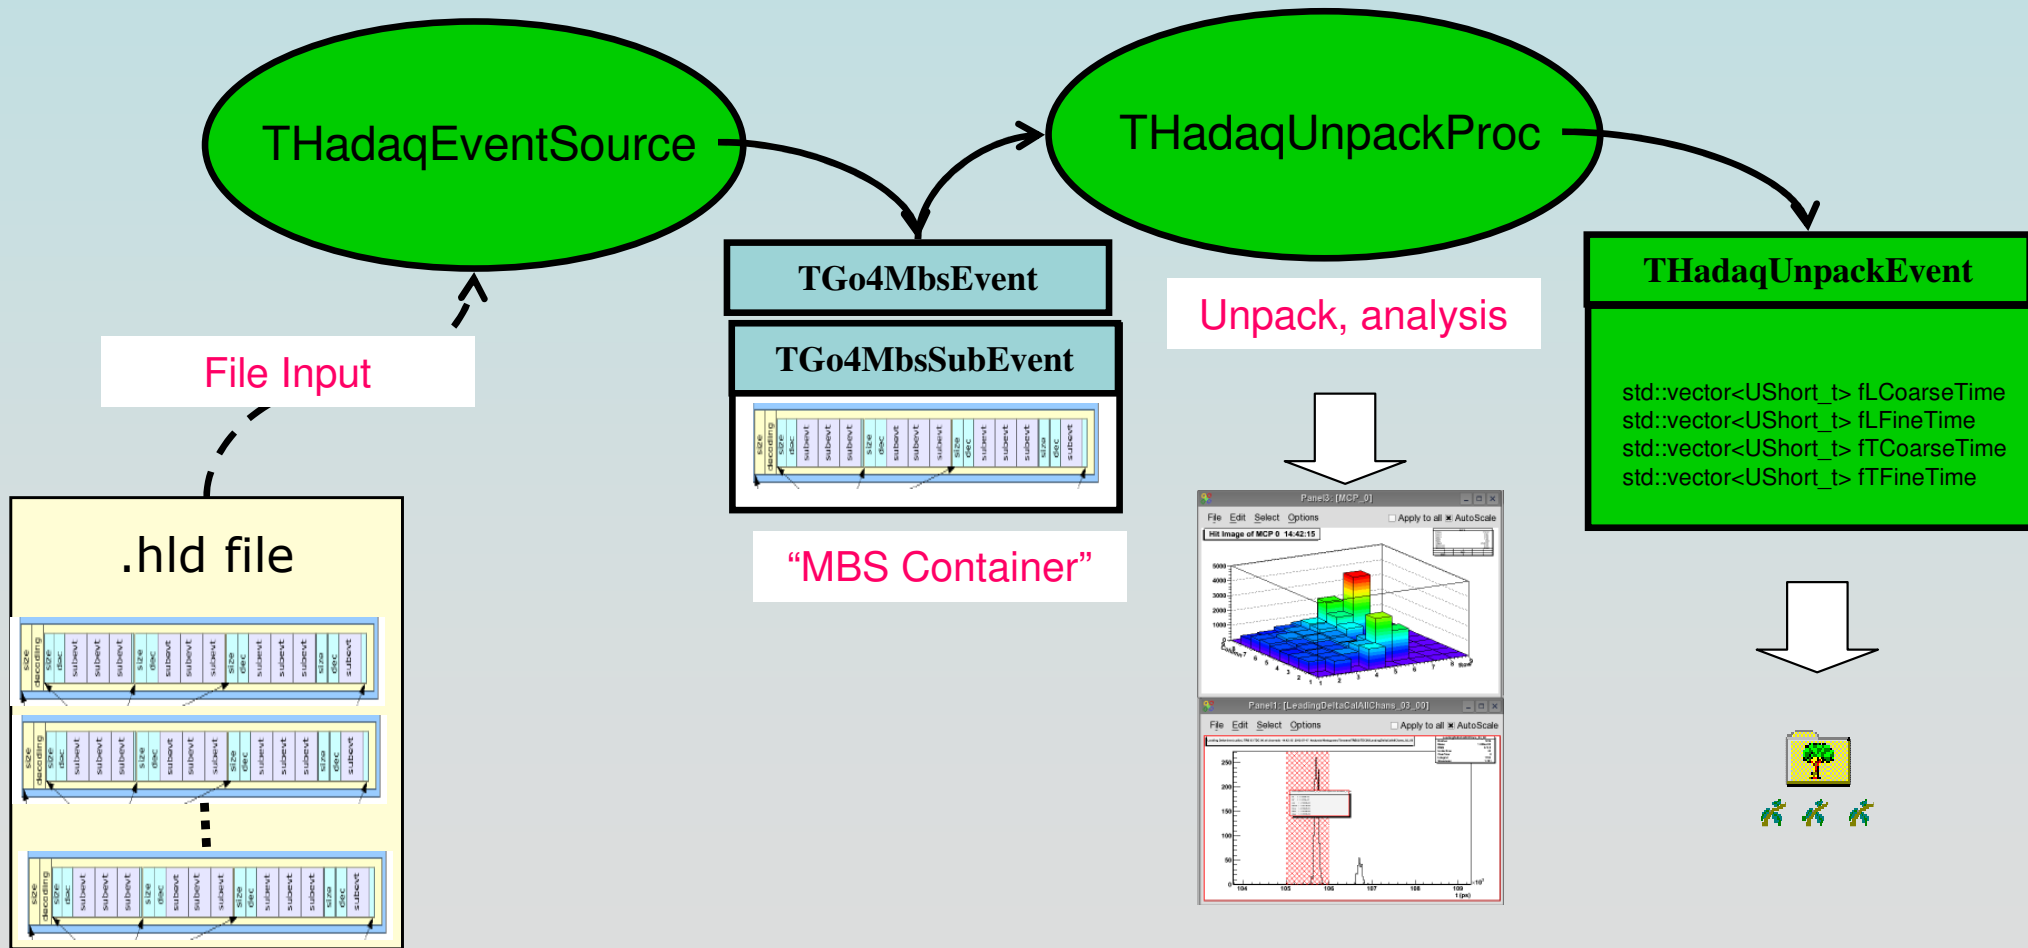

Goal: Integration of TRB frontends to CBM (PANDA, R3B?) test DAQ

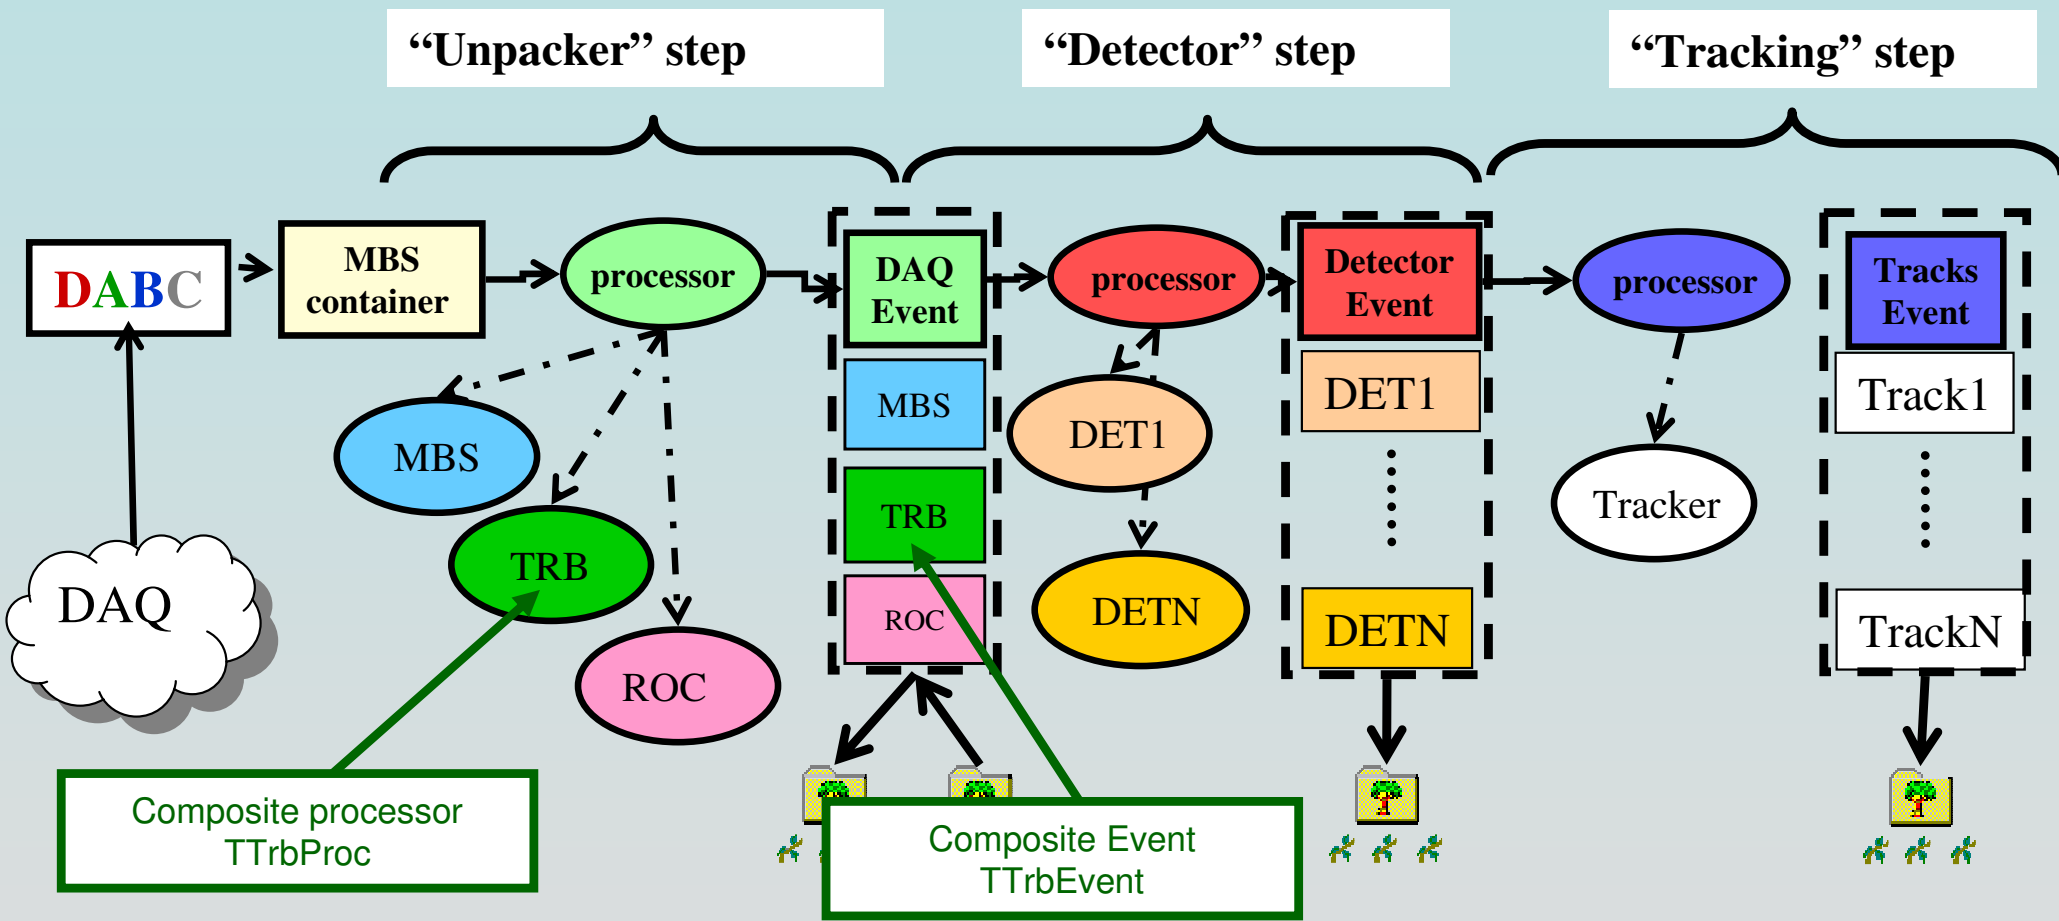

- **Read out TRB data with DAQ software DABC**
- **Combine hadaq events with mbs/roc/spadic data (common trigger or sync message)**
- **Data analysis with Go4 framework (process hadaq .hld files)**
- **Online monitoring with Go4 (at DABC stream server)**

- **File input for .hld files** (*THadaqEventSource*)
 - knows HADES hadtu / event / subevent formats
 - each **hadaq event is wrapped “as is” in a MBS subevent**
 - MBS output event is passed to subsequent unpacker
- **Data analysis class** (*THadaqUnpackProc*)
 - Can **dump any hadaq-formatted data**
 - Unpacking and histogramming of **TRB v2 and v3** formats
 - Time bin correction/calibration
 - Channel correlations + delta t evaluation (configurable)
 - Special MCP mapping for PANDA-DIRC / Mainz (Cahit Ugur)

Repository: <https://subversion.gsi.de/go4/trunk/applications/hadaq-go4>

hadaq-go4 adjusted to CBM beamtime framework (classes TTrb*.cxx):
<https://subversion.gsi.de/cbm/ROC/trunk/onlinemonitor/trbmonitor>

- Read .hld files
- Wrap hadaq event into MBS subevent
 - ⇒ export to .lmd file or stream server (-> Go4)
 - ⇒ **combine hadaq and mbs data** (to do!)
- Receive data from TRBnet hubs via udp sockets
- Combine hadaq subevents from different trb inputs
- Export control variables to shared memory
 - connect to HADES eventbuilder controls / EPICS
- Write .hld files

Like Go4
event source

CBM beam tests

Full HADES
eventbuilder!
(daq_netmem,
daq_evtbuild)

Repository: <https://subversion.gsi.de/dabc/trunk/plugins/hadaq>

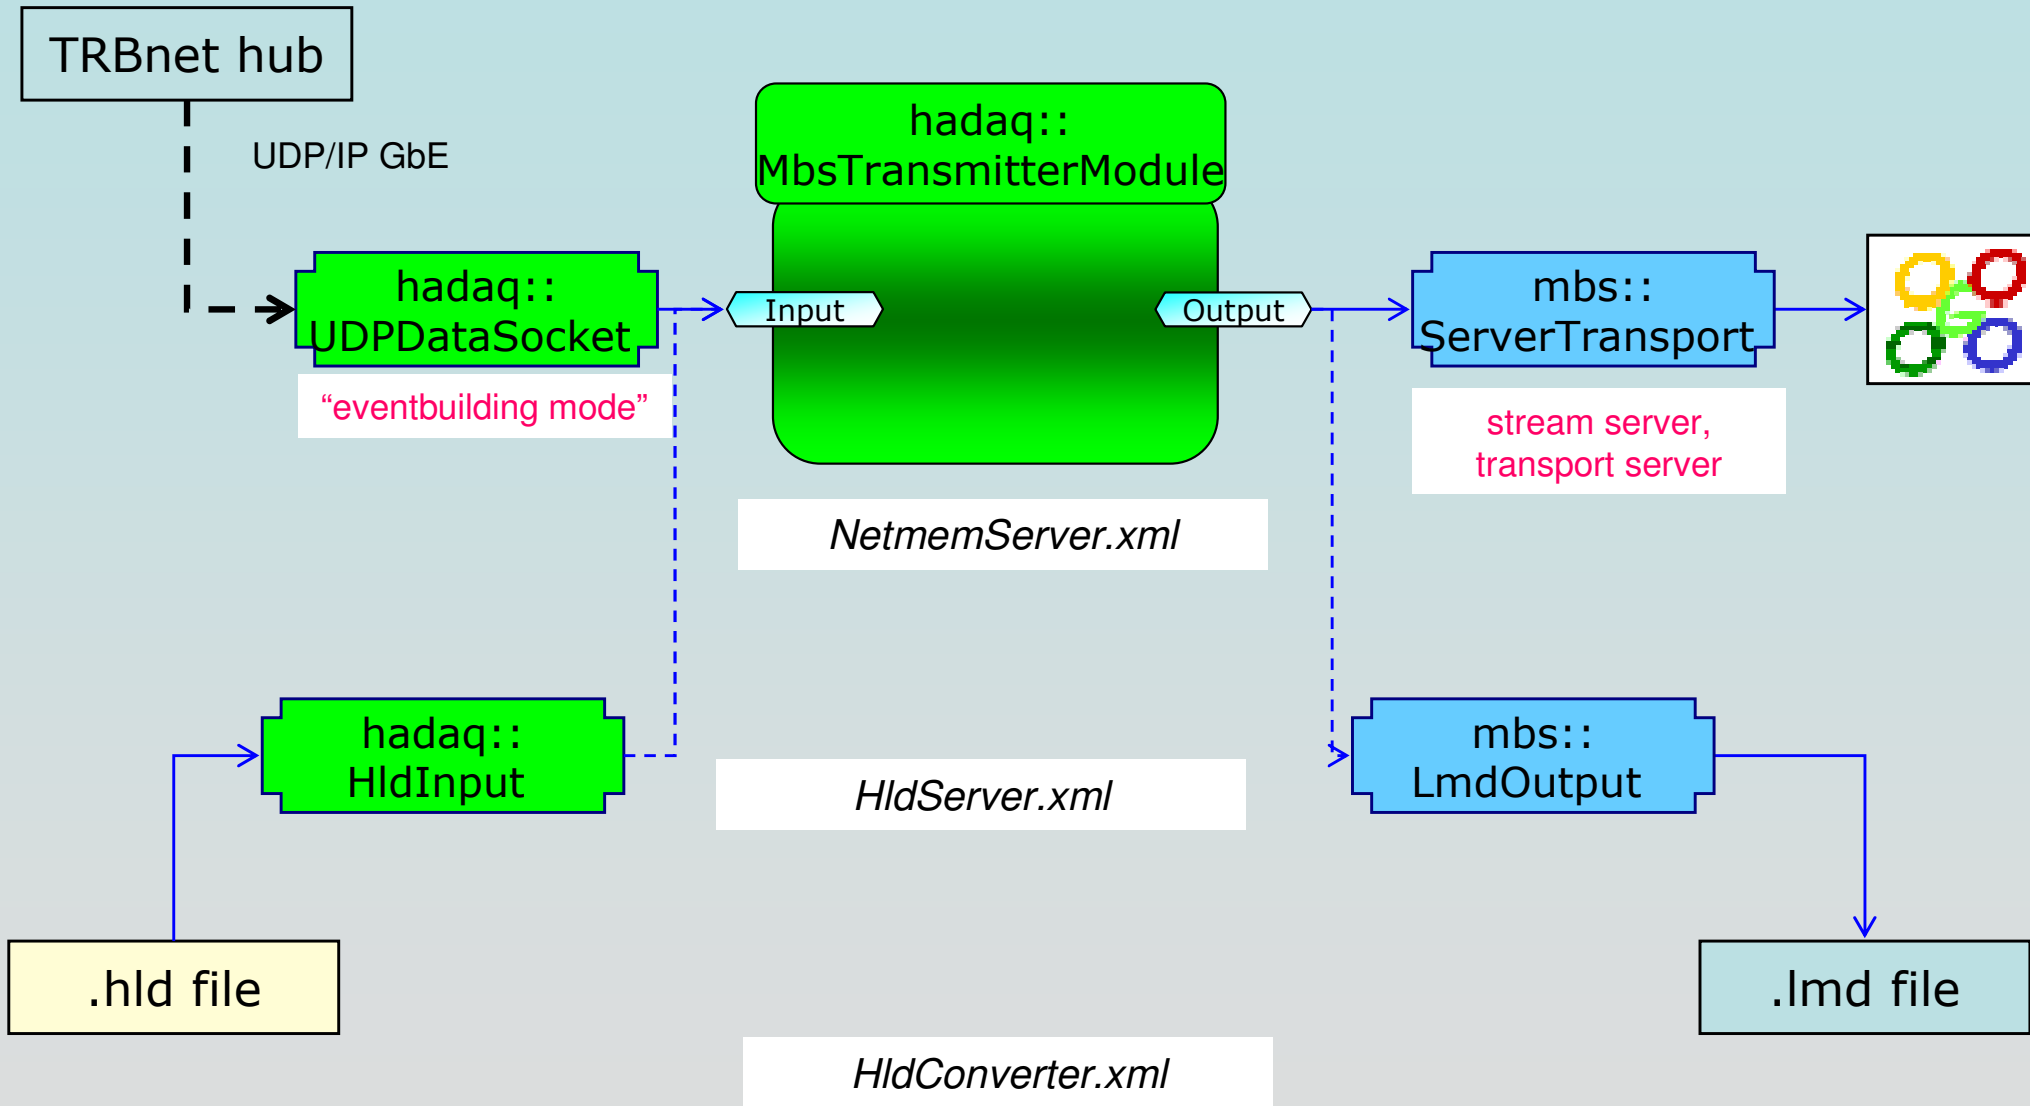

Classes:

- HldFile –
input and output of hld file format
- HldInput –
read hadtu format from file
- HldOutput-
write hadtu format to file
- UdpDataSocket –
receive hadtu packets from trb frontend (single stream)
- MbsTransmitterModule –
wrap hadtu format into mbs event container
- CombinerModule –
eventbuilding of hadtu format from several data streams
- Observer –
Control system interface to hades shared memory

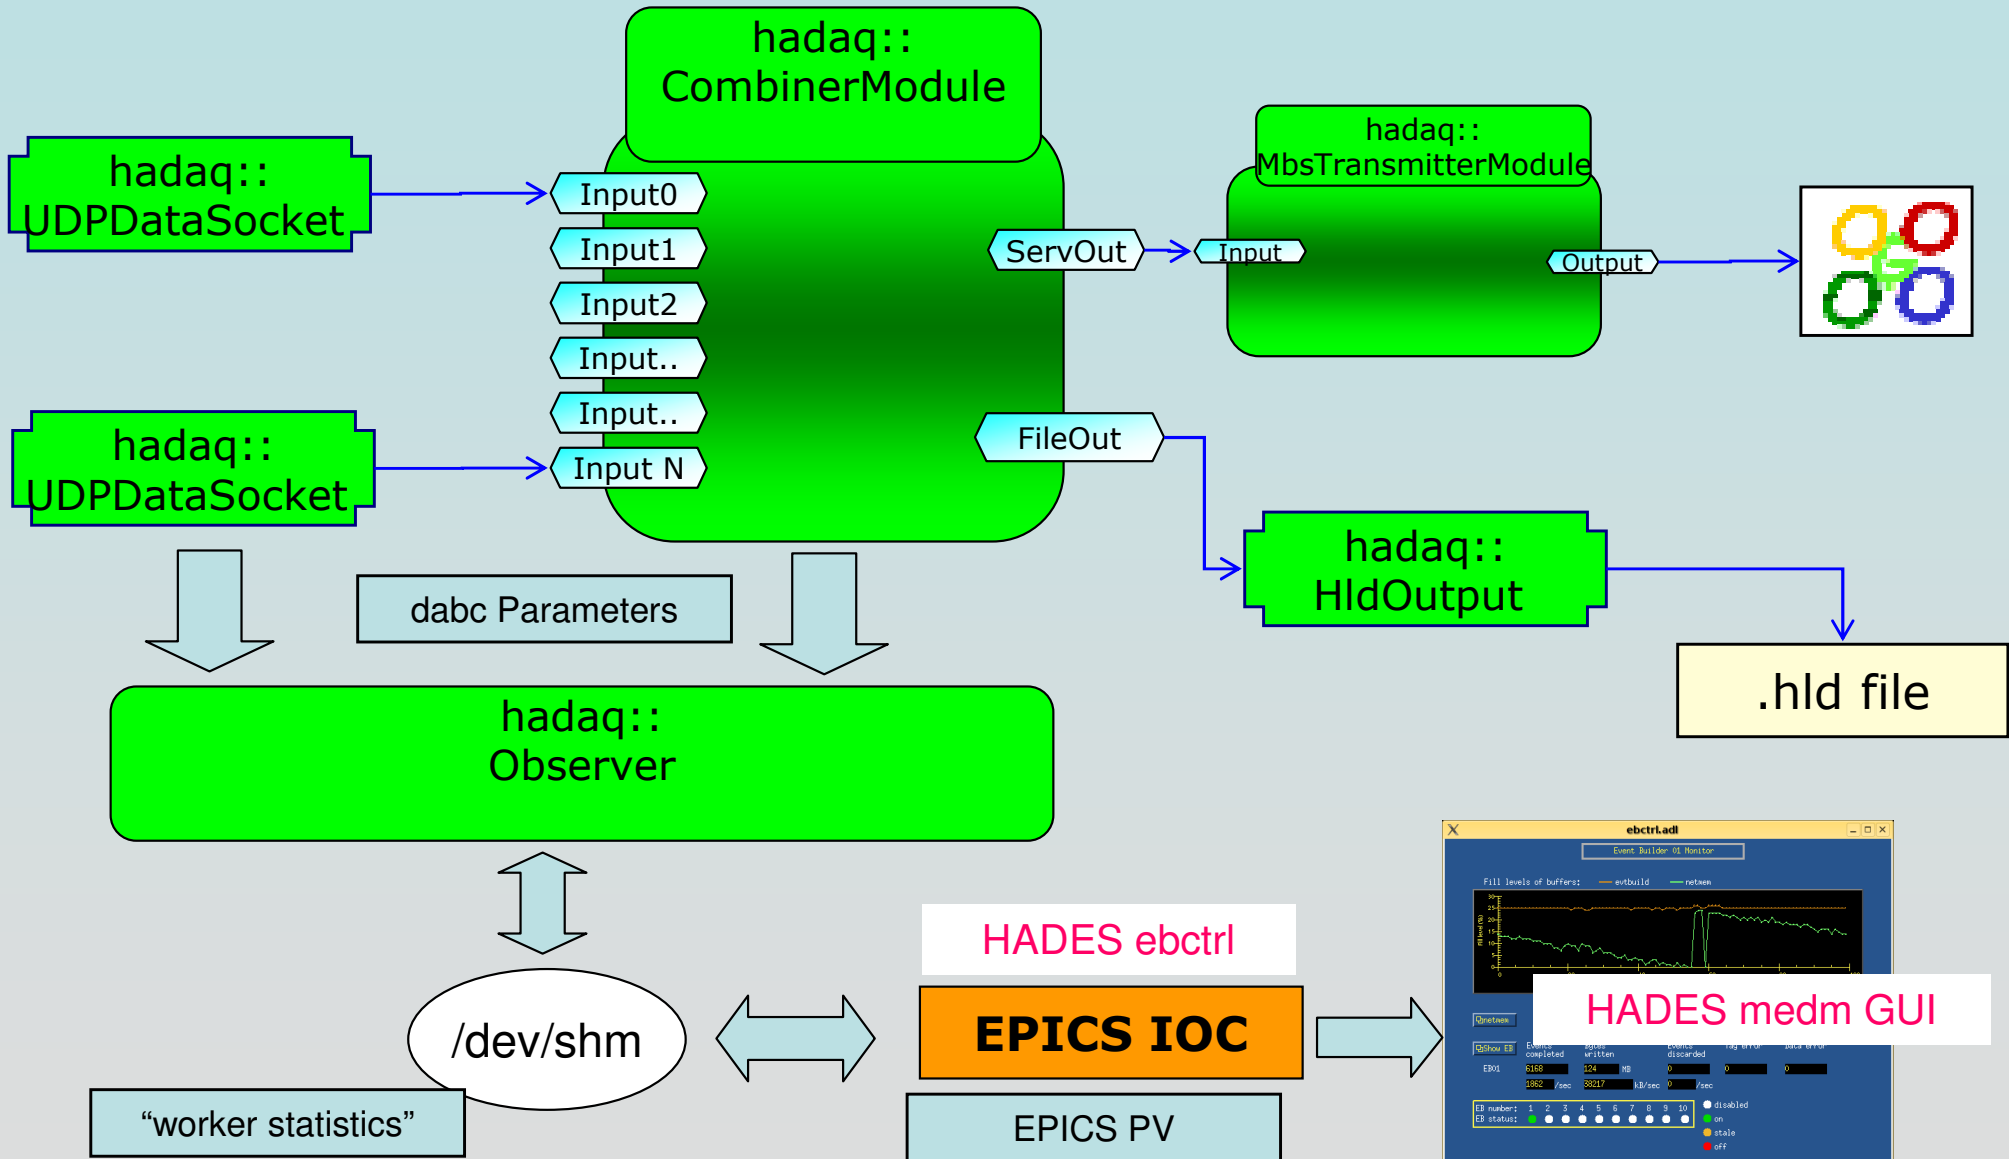

Example application configurations:

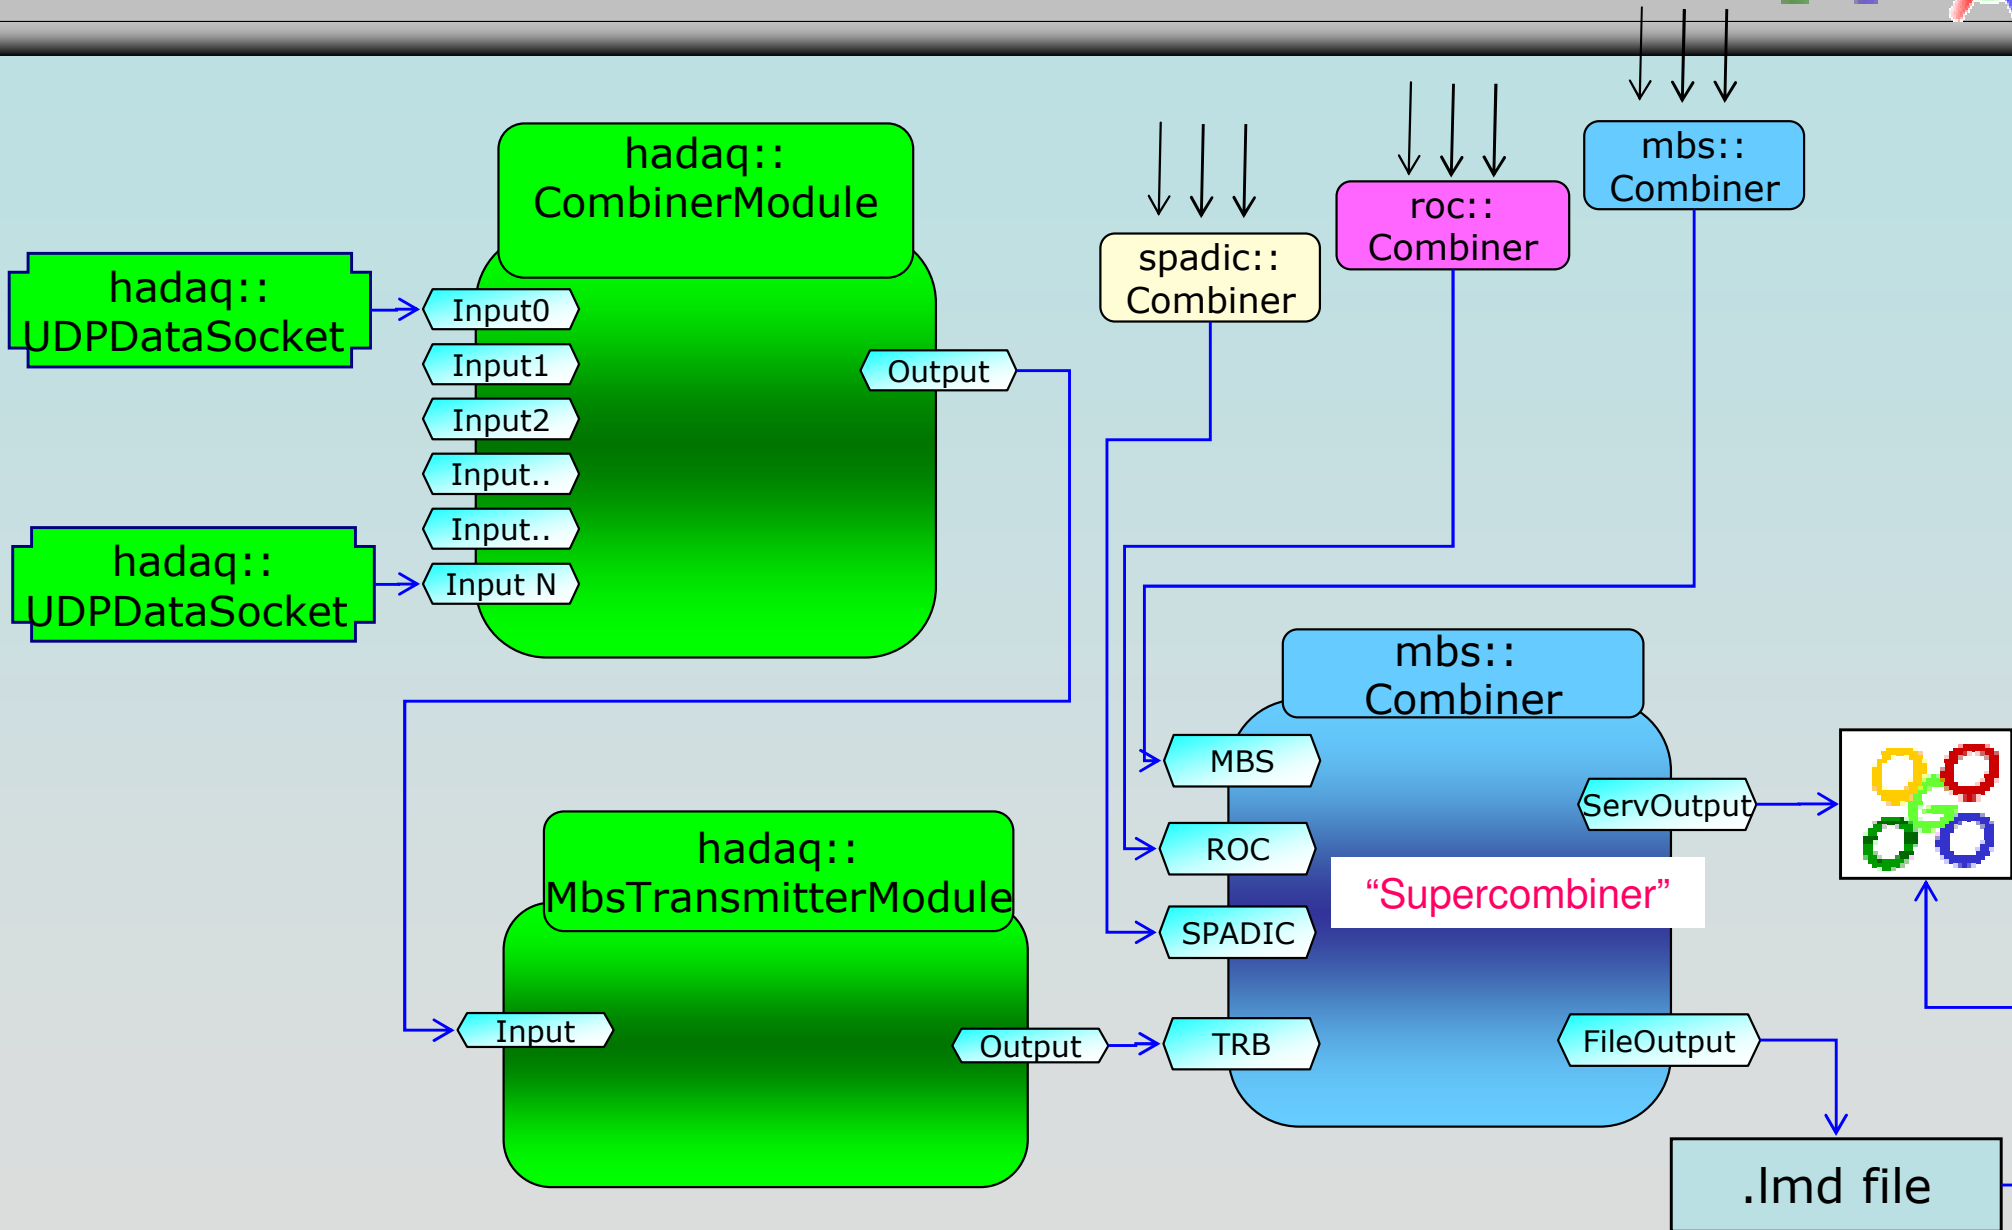

- *HldConverter.xml* –
read hld file and write to lmd file
- *HldServer.xml* –
read hld file and serve at mbs transport server
- *NetmemServer.xml* –
receive trbnet data at 1 udp socket and serve events at mbs transport/stream server
- *EventBuilder.xml* -
receive trbnet data at n udp sockets and do a full eventbuilding

EventBuilder.xml

PANDA-DIRC@Mainz (C.Ugur):

- hadaq-go4 for offline analysis of .hld files
(acquired with old HADES production eventbuilder)

Used for MAMI beamtimes June and July 2012

- *dabc_run NetmemServer.xml* + hadaq-go4 for online monitoring:

Usable, but **dabc fails for high event rates >40kHz? ?? Mb/s**

(queue full, or crash) => **dabc v1.9 debugging! Fine tuning of buffer setup!**

- *dabc_run EventBuilder.xml* + hld file output + hadaq-go4:

⇒ Works with 1 trb input up to some event rate limit, see above

⇒ **can not yet deliver performance (100kHz writing) of old hadaq eventbuilder!**

Tests with udp data sender simulator (JAM):

- *dabc_run EventBuilder.xml* + hld file output + hadaq-go4 + EPICS ioc + MEDM gui

With 5 UDP streams, localhost (10kHz/1000Bytes/ 20s spill):

19 Mbyte/s with file to local disk (41 Mb/s without file)

Limit: hld file io -> queue back pressure -> 60% dropped events

- ⇒ Go4 analysis of hld files and trbdata from DABC online is ready
(still under development)
- ⇒ Go4 trb classes adjusted for CBM online monitoring framework
- ⇒ DABC plugin for trbnet udp inputs is ready
TODO: trb/mbs super combiner implementation for CBM
- ⇒ DABC can almost **emulate the HADES production eventbuilder!**
(missing: RFIO, disk load balancing, multi-EBserver tests..)
- ⇒ DABC hadaq modules still **lack performance** of HADES eventbuilder
TODO: optimization of i/o implementations + memory set up
DABC v1.9 debugging (stability? error recovery?)
